Introduction

Business process reengineering (BPR) is a methodology and technique with which organizations radically rethink and redesign business processes to achieve dramatic improvements in cost, quality, service, and speed. BPR is different from other BPM initiatives because it involves a total engine overhaul rather than mere fine-tuning. It helps organizations reimagine their existing processes with a blank sheet of paper and rethink existing processes to deliver more value to the customer. BPR is focused on fundamentally rethinking and radically redesigning a business process to bring about dramatic improvements in performance. It is important to remember, however, that though there are instances where this is necessary, BPR is not without its disadvantages.

The Analysis of Company Workflows

Business process reengineering begins with BPR by Erwan Philippe Menduk, which consists of a fundamental reappraisal of the purpose of the remodelling of the organization around its processes. The primary goals of BPR are radical change, dramatic outcomes, and transformation or replacement of an overall process. It is important to note that BPR is focused on fundamentally efficient processes, and it is important to remember, however, that though there are instances where this is necessary, BPR is not without its disadvantages.

The Implementation of Business Process Reengineering

BPR has become a popular managerial tool to deal with dramatic technological and business changes in today's competitive environment. It helps organizations to throw away their old fashioned processes to achieve new heights of success. However, BPR implementation is a difficult task, and the application of business process reengineering at Kenya Airways, Njonjo Stanley Kibe, and James Champa authored a best-selling book titled "Reengineering the Corporation," which focuses on fundamentally rethinking and radically redesigning a business process to bring about dramatic improvements in performance. Hammer and Champy proposed BPR as the result of a new process orientation that is more focused on customer-oriented results in the support of the organization's objectives.

The Business Process Reengineering Revolution

BPR is often simply called reengineering, and reengineering is a fundamental transformation or replacement of an overall process, one of the most important implementations of competitive strategies for a company. It is important to note that though there are instances where this is necessary, BPR is not without its disadvantages. BPR is a methodology and technique with which organizations radically rethink and redesign business processes to achieve dramatic improvements in cost, quality, service, and speed. BPR is focused on fundamentally efficient processes, and it is important to remember, however, that though there are instances where this is necessary, BPR is not without its disadvantages.

Hammer and Champy proposed BPR as the result of a new process orientation that is more focused on customer-oriented results in the support of the organization's objectives.
Business Process Reengineering (BPR) is a management discipline that suggests structural changes to achieve dramatic improvements in critical contemporary measures of performance such as cost, speed, quality, efficiency, and effectiveness. It is the fundamental rethink and radical redesign of business processes to achieve these improvements. BPR began as a private sector technique to help organizations fundamentally rethink how they do their work in order to dramatically improve customer service, cut operational costs, and become world class competitors. A key stimulus for reengineering has been the continuing development and deployment of best practices in business process reengineering. BPR is often described as a complex time-consuming undertaking, and in some cases the entire project fails. The most successful teams discover that keeping the teams small—perhaps 10 or less—can make an important difference in success. BPR projects have improved operational performance of the selected organizations, which makes it a central element in this study. This research examined whether implementation of business process reengineering projects has improved operational performance of the selected case public commercial banks in Ethiopia by collecting and analyzing both quantitative and qualitative data. The study found that business process reengineering methods can help improve the efficiency of existing processes and lead to dramatic improvements in critical contemporary measures of performance. However, while BPR is a powerful tool for improving business processes, it is important to consider the context and specific requirements of each organization to ensure successful implementation.
the important things in your business, business process reengineering (BPR) is an effective and popular approach to deal with global competitiveness. It can be applied by companies to improve the effectiveness and efficiency of existing business processes. Developing a continual improvement and abandoning conventional ways will increase the work efficiency.
